

Patient risk-stratified, care coordination, and population health management software that uses predictive algorithms to drive patient risk assessments and clinical insights across the continuum of care. CareChain's comprehensive, flexible, and highly configurable system helps organizations reduce costs, streamline operations, and achieve better patient health outcomes.

CareChain At A Glance

Using ARGO CareChain software, organizations access a 360-degree view of patients and share key information with care team members inside and outside the hospital.

CareChain utilizes data to stratify patient populations, enabling organizations to effectively coordinate care, empower patients, and track performance.

Advantages

- Uses predictive risk analytics to determine patient risk factors
- Identifies post-discharge risks and interventions
- Seamlessly integrates with electronic medical records
- Reduces readmission penalties
- Maximizes in-network referrals

CareChain combines:

Population Health Management

Uses data to stratify patient populations, predict and track 30-day preventable readmissions, and monitor emergency department utilization.

- Clinical Decision Support
- Analytics-Driven Risk Models
- Cohort Analysis
- Population Health Measures

Care Coordination and Patient Engagement

Supports care management processes, including care transitions, referrals, and engagements to improve patient health outcomes.

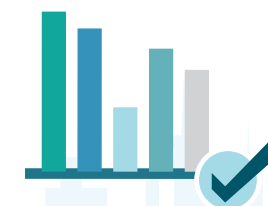

- Risk-Stratified Patient Registries
- Program Design and Governance
- Health Assessments and Personalized Care Plans
- Patient Outreach
- Transitions of Care
- Dashboards and Key Performance Indicators

Data Aggregation and Integration

Collects and transforms data from multiple sources, creating information that helps organizations assist each patient.

- Longitudinal Records
- Patient Identity
- Flexible Reports

How CareChain Improves Patient Outcomes

Care Team

The care team includes case managers, schedulers, care coordinators, social workers, patient navigators, and physicians.

CareChain transforms data from patients, claims, clinical systems, and community service organizations to determine the next best action.

Cohorts

CareChain stratifies patient populations into cohorts based on their risk (low, medium, high, and very high).
